

Functional and attractive

Metterwoon Vastgoed B.V., active since 1975, is one of the larger private real estate investors in the Netherlands. The organization manages about 8,500 houses, shops, shopping centres, business properties and hotels.

Metterwoon Vastgoed has moved into the building opposite their former premises on the Badhuisweg in The Hague. This bigger building offers more work space. The building also includes an underground car park. This car park, which was finished with rough broomed concrete, has been adapted to the requirements of the customer and the new building, namely functional and attractive. In order to realize this, they have found a good partner in Bolidt. After the subfloor had been levelled properly, Bolidt has applied the [Boliccoat](#)[®] 50 RF system. This system is not only wear resistant, but also has a non-slip finish.

The access ramp into the garage has been finished with the Bolidt/Siemens system. This heated system is ideal for this type of ramp. In the event of snowfall or frost there needs to be no fear of driving on a layer of ice. Snow and ice cannot build up on the top surface, as it will remain above zero.
